@betterworldmuse
Hi, I'm Becca.
yup, I'm 12 😊

Follow me on Instagram @lifeorb_better_world for science & innovations of the "Life Orb" Edible Indoor Garden
betterworldmuseum.com

lifeorb_better_world DNA extraction is the first step in genetic modification, also known as genetic engineering. This is a simple process that can be done at home! All you need is 10 mL of dish soap, 10 mL of water, some isopropyl alcohol, or rubbing alcohol, a strawberry, some small containers and tweezers. First, put 1/16 of a cup of rubbing alcohol in the freezer and wait at least 15 minutes; (30 is best). Then, mix the dish soap and water with the strawberry that has been mashed, strain that and pour the cold isopropyl alcohol on top. Let this sit about 30 seconds, then stir the top gently and slowly
Rebecca's Research: Pollinators

Pollination is a vital part of any plant's survival, and with 75% of flowering plants depending on it, bees and other pollinating insects are crucial to their success. Not only insects pollinate, either; in fact, over 1,000 pollinators are vertebrates, including bats, birds, and other small mammals. If you love flowers, or gardening, or food, really, then next time you see a bee or a bat, don't try and scare it away or kill it; just tip your hat.

Rebecca's Research: Roses

Roses are one of the most beloved flowers, with over 4,000 species and countless cultivars. They can grow through a variety of climates and soils to reach stunning heights. Roses are beautiful for cut flowers, bouquets, and even pies, jams, and jellies. Black and blue roses are just as stunning as their red, yellow, and pink counterparts. No! No! Black and blue roses are just as beautiful as red, yellow, and pink ones and have much more nutritious value.

Research: Green Beans

In salad, cooked, or eaten raw, they have been loved for centuries. One of the first cultivated plants, there are three well known types: string, stringless, and runner beans. The first stringless beans were created through selective breeding by Botanist Calvin Keeney in 1894.

Leaves of the green bean plant are covered with tiny hairs used for trapping small bugs, protecting them from insects munching away. Green beans also produce flowers of the white, purple or pink variety, but the plants are annual, meaning its life cycle is only one year.
LIFE ORB - COMMUNITY GARDEN -

- Environmental sensors

Traits:
- 🌬️ = Dry
- 🌊 = Water
- 🌶️ = Pick

Features:
- LED color-coded
- Destructible public access to internet
- Castors so can push in atrium
